

POLYSOL SL

General prespotting product for brushing and spraying application on prespotting tables or spraying equipment

Characteristics

Prespotting agent with specifically effective raw materials which produce a high cleaning action.

POLYSOL SL may be used in perchloroethylene and fluorocarbon solvent R 113.

Effect

POLYSOL SL does not contain chlorinated solvents, and when sprayed, it shows no skin or other irritation effects.

POLYSOL SL intensifies the cleaning action on the stained portions of the garments and may be applied by a brush or a spraying equipment.

It has a solubilizing and softening effect with regard to wet- and oil-bound stains.

This effect allows easier removal of stains during the following drycleaning process and thus the actual spotting work is reduced considerably.

The percentage of dry-cleaned garments which will have to be treated by the spotting and wet cleaning process is considerably diminished by this method, so that the final stainfree output of the dry-cleaning installation is increased considerably.

Application

Use **POLYSOL SL** in case of wet-bound stains, perspiration stains and in case of spots caused by wine, milk beverages, foodstuffs, beer, fruit juice, etc.

In case of tenacious grease or soiled areas on the collar, sleeve lining, trouser pockets, as well as for preliminary treatment of trenchcoats, **POLYSOL SL** has been found to be especially effective.

In case of very badly soiled garments which are not sensitive to moisture, the brushing or spraying may be done with

**1 volume part POLYSOL SL
and 0.5 to 1 volume part water
for use in perchloroethylene**

**1 volume part Polysol SL and
0.5 volume part water**

for use in fluorocarbon solvent R 113

It is recommended to treat delicate garments as well as knitted garments made of pure wool with a mixture of

**1 part POLYSOL SL
and 1 part perchloroethylene.**

Light coloured and delicate material should not be kept in prespotted condition for a long time, but drycleaned soonest.
